

PENSION MATHEMATICS (ACT 470H1)

Course Outline (follows Anderson BUT see readings)

Week#	Description
1	Intro to Pensions/Anderson ch. 1,2.1
2	Anderson ch. 2.2-2.6
3	Anderson ch. 2.7-2.11
4	Anderson ch. 3.1-3.5
5	Anderson ch. 3.6, 4.1-4.4
6	Anderson Ch 3 Reading Week
7	Mid Term
8	Anderson ch. 5/6
9	Anderson ch. 6/7
10	Cost Methods revisited
11	Review
12	Review

Assignment #1 – due January 27 – by email to howard.lyons@aon.com – 9 pm

Assignment #2 – due March 3 – by email to howard.lyons@aon.com – 9 pm

Assignment # 3 – due March 24 – by email to howard.lyons@aon.com – 9 pm

PENSION MATHEMATICS (ACT 470H1)

Course Readings

- Pension Mathematics for Actuaries (Third Edition), by A.W.Anderson, Chapters 1-7.
- A Problem-Solving Approach to Pension Funding and Valuation, 2nd Edition – William H. Aitken
- Selected other readings and notes that will be posted

Grading Outline

Assignments (3x10)	30%
Mid-term Exam	30%
Final Exam	<u>40%</u>
Total	100%

PENSION MATHEMATICS (ACT 470H1)

Course overview of ACT 470 – University of Toronto

Course contents / approach: ACT 470 covers and introduces the students to the fundamental concepts of pension funding and actuarial cost methods. The course focuses in on private pension plans, pricing and valuation of liabilities and assets. Emphasis is also placed on gain loss analysis and selection of actuarial assumptions.

The course material is based on Anderson, Pension Mathematics for Actuaries and on Aitken, Pension Funding and Valuation. The course is taught over a 12-week period – problem sets, Midterm and Final exam.

The material is broken down as follows:

- Introduction to pension plans ,legislation ,terms and conditions and different types of plans and funding implications – defined benefit vs defined contribution
- Calculations of pension benefits and prevalence in the Canadian market – Career Average vs Final Average vs Flat dollar plans. Advantages of each benefit calculation and plan terms
- Actuarial cost method introductions and detailed development of methods from first principles. Definition of Normal Cost and Actuarial liability and application to valuation reports
- Further work on cost methods – level dollar methods ,level% of pay methods – example of application of Unit Credit ,Entry Age normal, Attained age normal ,Aggregate Method ,Frozen Initial liability method.
- Development of Gain / Loss by source and by plan as a whole. Development of each term of Gain and Loss
- Asset review ,application of various asset valuation methods and gain/ loss application
- Actuarial equivalent and postponed retirement
- Appropriate actuarial assumptions and development and choosing appropriate terms
- Contributory plans and further development of cost methods
- Further development of gain and loss – review of actuarial report and application of various cost methods to specific plan

The student once they complete this course, should be very familiar with all of the cost methods and able to apply and develop from first principles and work through all types of gain/ loss scenarios. They should also be very familiar with a valuation report and able to articulate movements and changes given the course material
